Individual Lab 1

After experimenting with gdb, I think it's a handy tool. It helps you debug a program quite easily rather than before where I had to go through the program line by line without really knowing what went wrong. I think the main advantage of gdb would only be realized after I start using it to debug a bit more complex program. One of the things which I like about gdb was that it was already inbuilt in the server and is also inbuilt in visual studio. The thing I like least about gdb is that it requires extra steps to run it.

So to experiment with gdb I started manipulating the simple.cpp to create a bunch of errors and then by using gdb is solved it one by one.
